

Healthy Trees Create Healthy Communities

Trees provide a natural dose of preventative medicine.

FREE WEBINAR SPONSORED BY PRIORITY HEALTH AND THE MICHIGAN DNR

New research shows that the closer you live to trees, the better off you are. Learn how trees impact our health in measurable ways.

Trees and greenery offer a host of health advantages. They can help prevent heat-stroke, clean the air, improve breathing, help you sleep better, relieve stress, lower your chance of diseases, improve your mood, create a defense from depression. Planting more trees beautifies urban neighborhoods and keeps residents feeling better. Even in highly wooded areas, tree loss is tied to a rise in disease and higher mortality rate.

The presentation will be led by Melinda Jones. For the past 20 years Melinda has worked as a consulting forester and the executive director of ReLeaf Michigan. She has served on the Executive Board of the International Society of Arboriculture (ISA) and was the 2018 recipient of the ISA Sharon Lilly Award of Distinction. Melinda holds a degree in Forestry from Michigan State University and has over 45 years of experience in the Green Industry.
